For State Superfund Sites, we use the Texas Risk Reduction Rules (TRRP). If going off-site we also refer to the Land-ban Disposal Rules (LDRs). Shouldn't the RP prepare a list of ARARs that show what they are required to do?

Alvie:

I am contacting you to let you know that BNC is considering constructing a 1 acre bioremediation cell to degrade hydrocarbons associated with grossly contaminated soils located on the property. I generally do not have big problem with this action but we will need discuss this action. Is there anything specific that TCEQ looks at to determine the extent of degradation that needs to be accomplished?

Please keep in mind that this is a preliminary proposal and may not actually happen. I am sure that they intend on running the numbers on this to see if it is actually feasible relative to offsite disposal of the contaminated soils.
